ARCHITECTURAL METALS

Overview

The Volare system is a tension façade which has many different aesthetic options. The panels may be perforated, plain, or a combination of the two to create a unique appearance. Finish options include standard colors and Porcelite's full color imaging. Or the panel can be imageperfed which employs a customized perforation pattern to create a unique image.

The Volare system is mounted to the structure through a system of steel cables or tubes that are attached to the structure. It should be noted that the use of cables for a mounting system should only be used if the building is designed around the Volare system. A tube mounting system is easier and cheaper and can be mounted on pre-existing structures.
